

Composition of Integrated Power Supply in Substations

Overview

The AC/DC integrated power supply of substation consists of the substation AC power supply, DC operational power supply, UPS and communication power supply, etc. A substation has protection devices that safeguard the. Abstract: As a necessary power source for substations and other important power-using places, substation power supply system provides working power for important loads such as control devices, relay protection, communication equipment and fire security systems. The purpose of this guide is to give an overview of the guidelines and requirements specified by current regulations for the design and construction nt V1: Syst uary 2008, updated by the Decree of 19 July. Integrated power distribution system in a free-standing enclosure, with or without aisles. Copper wires connect the analog output from the transformers to secondary equipment, and the number of copper wires. To better understand the importance of electrical substations, let's start with a discussion about the structure of the power systems and their main components. Power System Structure The typical power system structure is shown in Fig. Where: 1 = Generator 2 = Generating station's step-up.
