

# Concealed cable laying in distribution boxes

## Overview

This pocket guide provides an overview of the requirements for the installation of cables concealed in structures in accordance with regulation group 522. 6 of BS 7671:2018+A2:2022 (IET Wiring Regulations 18th Edition). Understanding the types of cable containment systems, including trays, trunks, and conduits, helps engineers and contractors select the best. After determining the routing of the cabling, a network cabling project initially needs to consider the laying of cable trays, which can be made of metal, conduit, or plastic (PVC) tubes based on the material used. From the scope of tray-laying, it can be divided into work area trays, distribution. Cableduct containment units are the perfect solution for the safe concealment and distribution of electrical, audio-visual and data cabling. They can be integrated with our floor box range or be a stand-alone solution. This practice directly influences the long-term reliability and performance of connected systems. Proper management prevents physical damage to conductors, which can lead to signal loss or. Concealed installation is used in interior spaces.
