

Direction of network rack cooling fans

Overview

The cold air flow patterns from the bottom to the front part of the server, forced by the small cooling fans integrated and cooling down all the components such as memory device and processor, where the biggest amount of heat is generated. What direction should the airflow be on the rack fans. I have a 25U server rack, with glass front, it has some grills cut around the rack, and has 4 top mounted fans. They seem to be sucking in air, but I feel like it should be an exhaust?

Overall temps of the servers seem fine, I have just 3. The foundation of data center airflow management is the Hot Aisle-Cold Aisle design, where cabinets are placed in alternating rows, with IT air intakes (cold aisles) and IT air exhausts (hot aisles) each facing one another. Best If the airflow inside could be the reverse, I'm pretty sure the fans would be equipped with some switch or jumper to determine the direction. Choosing the right type of fans and positioning them properly allows data center managers to bring cool air in from.
