

Fiber optic cable right angle in conduit

Overview

Fiber optic cable has a strict minimum bend radius, and sharp turns significantly increase friction and pulling tension. Instead of using 90-degree elbows, gentle, sweeping bends or specialized fittings should be utilized, especially where the conduit enters a building. The preferred size for the figure-eight coil is about 15 ft (4.5 m) in length, with each loop 5 ft (1.5 m) in length. Traffic cones spaced 7-8 feet apart are useful as guides. Innerduct provides a good way to identify fiber optic cable and protect it from damage, generally a result of someone cutting it by mistake! You can get the innerduct with pulling tape already installed. Create a detailed, written plan of installation. The Problem: Bending a fiber cable beyond its limit causes "micro-bending" or "macro-bending." (2) the pulley on the truck used to turn the cable toward the capstan pulling it is 5-6 times too small for the cable - the red dotted circle shows. Fiber optic cable transmits data as light pulses through thin strands of glass or plastic, offering high speed and bandwidth.
