

Fiber optic module has light but is not recognized

Overview

The optical power is normal, but the link cannot be connected. The use of faulty or incorrect cables, improper cable wiring, or the presence of loops within the cable can all result in such. However, even in well-designed infrastructures, engineers frequently encounter issues such as SFP modules not being detected, no link light after installation, or unstable fiber connections. These problems can disrupt network performance and require systematic troubleshooting to resolve quickly. This is a high-level summary of the situation, but it's really strange (and YES, I have. This article describes steps to perform when SFP/SFP+ fiber link is not coming up. Scope FortiSwitch and FortiGate. Ensure that a compatible transceiver is used. Since switches indicate a status of "Not Detected," SFP optical module failure usually occurs in two ways, the transmitting end and the receiving end.
