

Grounding materials for low-voltage distribution boxes

Overview

A low-voltage grounding system comprises the following components: Protective Conductors: Connect equipment casings to the grounding system. They are considered to be the same with respect to safety of people against indirect contacts. Quantities that can be calculated. Where continuity of service is a high priority, high-resistance grounding can add the safety of a grounded system while minimizing the risk of service interruptions due to grounds. The concept is a simple one: provide a path for ground current via a resistance that limits the current magnitude, and. In low-voltage networks, which distribute the electric power to the widest class of end users, the main concern for the design of earthing systems is the safety of consumers who use the electric appliances and their protection against electric shocks. System Stability: A. This Grounding Standard describes the technical requirements for grounding the SEC Distribution Network installations. SEC Distribution System extends from the MV (33 kV, 13.8 kV) feeder outlets of HV / MV Substations down to SEC Customer interface including KWH-Meters and meter boxes.
