

High temperature inside the distribution box

Overview

Target Temperature: Keep internal temperatures below 95°F (35°C) to ensure safe and efficient operation. Passive: Vents, shade, and natural airflow – best for mild conditions. Outdoor low-voltage power distribution boxes (hereinafter referred to as "distribution boxes") are low-voltage distribution equipment used in 380/220V power supply systems to receive and distribute electrical energy. They are generally installed at locations such as the low-voltage side of. Protect the life of distribution box in high UV and extreme temperatures with UV-resistant materials, insulation, ventilation, and regular maintenance. They should work well and remain reliable in any environment. In hot climates or closed mechanical rooms, the inside of that box can really heat up. Choose high-temperature-resistant special models For high-temperature areas such as industrial workshops and near equipment, prioritize ZCEBOX. In the daily maintenance of power distribution systems, the biggest concern is the unexplained overheating of the wiring terminals.
