

How to connect the grounding wire of a relay protection device

Overview

The grounding of the assembly must be done with a wire, a tab and a bolt attached through a separate hole from fixing screws. System grounding Ground or earth provides a common return path for electric current in an electric circuit. It is created by connecting the neutral point of an installation to the general mass of the earth or a chassis. Grounding is needed for electric safety and it also creates a reference point. To understand the system voltage relationships with respect to system grounding, it must be recognized that there are two common ways of connecting device windings: wye and delta. These two arrangements, with their system voltage relationships, are shown in Wye and Delta Winding Configurations and. Ungrounded: There is no intentional ground applied to the system-however it's grounded through natural capacitance. Also principles of various protective relays and schemes including special protection.
