

How to test fiber optic cables using OTR

Overview

To perform an OTDR test correctly, you must: 1. Set core parameters (Wavelength, Distance, Pulse Width); 4. Run the test (Real-time or Average); 5. This test will acquire a trace of an installed fiber optic cable plant, singlemode or multimode, including the loss of all fiber, splices and connectors. The method shown is on the FOA "1 Page Standard" FOA4 which you may print or download and insert in your documentation. OTDR appropriate for. As fiber deployments become commonplace, network owners and technicians are paying more attention to the two crucial devices for testing fiber optical cables: the Optical Loss Test Set (OLTS) and the Optical Time Domain Reflectometer (OTDR). An OLTS provides the most accurate insertion loss. A fiber inspection scope (also called a fiber microscope) magnifies the connector endface at 200x-400x so you can see contamination, scratches, chips, and damage that are invisible to the naked eye.
