

# Inverted Bridge Formwork

## Overview

"Hydraulic inverting bridge formwork" refers to specialized formwork systems used in bridge construction that utilize hydraulic power to manipulate, position, strip, and advance the formwork. The "inverting" aspect typically means that parts of the formwork (or the entire local form assembly) can. The Hamburg Port Authority (HAP), the agency responsible for the infrastructure of the Port of Hamburg, wants to improve the flow of traffic across the Süderelbe River by building the New Kattwyk Railway Bridge. Hydraulic formwork and shoring partner on a new flyover ramp connecting Interstate 4 to the Florida Turnpike. This \$80M design-build construction project provides an increased level of traffic safety to the interchange. EFCO provided a column and cap formwork package. Structure: Hydraulic driven self-propelled mobile trestle, mainly composed of seven parts: front axle, main axle, rear axle, front bracket, rear bracket, walking drive device, and walking bracket. Function: While carrying out construction under the bridge body, it can allow vehicles to pass through.
