

Laser Diode Focusing Characteristics

Overview

Abstract Laser diode beam propagation characteristics, the collimating and focusing behaviors and the M2factor are discussed using equations and graphs. Thin lens equation modified to be applicable for laser beams is introduced. An example about collimating and. Laser diodes (LD) are semiconductor devices that convert electrical energy into high-power optical energy. These devices are currently used in the fields of telecommunications and medicine and in industrial cutting and welding applications. This article discusses the characteristics common to laser. When using a laser diode it is essential to know its performance characteristics because they can easily be destroyed if the circuit conditions are not right. The prompt for going back and revise the foundations themselves of laser diode modelling has been, for the Authors, the difficulty. A laser diode (LD, also injection laser diode or ILD or semiconductor laser or diode laser) is a semiconductor device similar to a light-emitting diode in which a diode pumped directly with electrical current can create lasing conditions at the diode's junction.
