

Meaning of APD in Fiber Optic Communication

Overview

An Avalanche Photodiode (APD) is a type of photodetector used in optical communication systems for converting light into an electrical signal. As a core component of optical transceiver modules, these devices ensure seamless high-speed data transmission across networks. In this regime, carriers (electrons and holes) excited by absorbed photons are strongly. The avalanche photodiode or APD was designed by a Japanese engineer namely “Jun-ichi Nishizawa” in the year 1952. Compared to a PIN photodiode, APD offers internal gain and has the. ENF is a critical parameter in APDs that quantifies the additional noise introduced by the avalanche multiplication process. It impacts the overall noise performance and limits the APD's signal-to-noise ratio (SNR). What is a Noiseless InGaAs® APD?

A Noiseless InGaAs® APD is an APD with an excess. In an APD, a photon of light entering the device creates an electron-hole pair.
