

Mini-module data center quota pricing

Overview

A 2025 US development cost guide from Cushman & Wakefield reports facility construction costs clustering around \$9.0M per MW of critical load across major US markets, with an average near \$11. Here's the uncomfortable truth about modular data center cost: there isn't one. The vendors who quote you €X per kW without those inputs are either. Data center pricing varies widely depending on the type of service, the amount of space required, power draw, and contract length, but understanding the key pricing models helps businesses budget accurately. The most common pricing structures are per-rack unit (U) pricing for colocation. Actual data center costs can vary greatly from this model; the primary value of this tool is to evaluate how each cost input affects the lifetime cost differences between the two approaches. After 10 years, building is 12.7% less expensive than colocation with a break-even at < 6 years.
