

Optical module wavelength incorrect

Overview

Next, verify whether both optical modules match in wavelength, speed, and transmission distance. Finally, confirm VLAN and gateway configurations. Wavelength mismatch is a deceptively simple phrase for a problem that silently defeats optical designs and network links. At its core it means “the light used during fabrication or transmission does not match the light the device expects to see in operation. Therefore, it is essential to select optical. 1, the reasons for compatibility problems: A, compatibility code import process errors; B, the software update of the device leads to the original unupgraded compatibility code can not work; C. Therefore, understanding common optical module. Incorrect wavelength selection can cause light beam problems such as weak material interaction, unexpected reflection, poor beam quality, and inefficient energy transfer.
