

Otn uses wavelength division multiplexing technology

Overview

In the optical transport network (OTN), DWDM (Dense Wavelength Division Multiplexing) technology is used to achieve high-speed data transmission by simultaneously transmitting optical signals of multiple wavelengths on a single optical fiber. The diagram titled “The multiple layers of the OTN network” clearly illustrates how the various layers within the OTN framework work together to ensure smooth transport of different client signals, including Ethernet, Fiber Channel, MPLS/IP, and SDH/SONET. The Optical Transport Network (OTN) is. OTN—or Optical Transport Network—is a telecommunications industry standard protocol— defined in various ITU Recommendations, such as G. Similar to the division of large and small lanes on streets, the WDM system can be divided into two types: CWDM (Coarse Wavelength Division Multiplexing) and DWDM (Dense Wavelength Division Multiplexing).
