

# Should I add another PoE switch to this one

## Overview

Yes, Connecting PoE Switch to each other is multi-purposed and part of evenly distributed network operations. By interconnecting two PoE switch, organizations can significantly expand their network capacity, accommodating additional devices and users without compromising performance. Should I pull up to 600' of new cat6 into my garage or just 100' and add a small PoE switch?

I'm extending my physical network by adding new Ethernet drops throughout the house. One of the goals is to replace all WiFi cameras with PoE cameras, terminating in a self-hosted NVR. The garage has six. Just reuse teh POW cables that are already up there, and instead of them connecting to POE Wifi adapters, connect them to a POE switch (which would also allow me to add more cameras later) and drop a line from that switch into the main switch in the house. Would there be any problems/secrets in adding a second unmanaged 8-port switch?

The second switch would connect to the same Ethernet hub the first switch uses. The ease of use of this. Do note that you should not send a PoE signal from one PoE switch to another switch. If the PoE switch is smart enough, it will just not work, but if not, then you will burn out the other switch.
