

The layers of optical fiber communication networks are divided into

Overview

The optical network layer is structured into three layers: the access layer, the aggregation layer, and the core layer. This overall framework works together to realize the network's efficient and robust data transmission function. Cabling, including fiber optics, is covered in the Layer 1, the PHY or physical layer. Moving upward, the. From an architectural standpoint, fiber-optic communication systems can be classified into two broader categories: Point-to-Point (P2P): Connects two endpoints directly, offering high bandwidth and ideal for long-distance transmission. Point-to-Multipoint (P2MP): Splitters are used to distribute a. The process of optical communication breaks down into a few simple steps: E/O converters use light-emitting elements such as semiconductor lasers, O/E converters use light-receiving elements such as photodiodes, and optical elements such as lenses are used at the input and output of optical fiber.
