

The optical patch cords of both switches are not working

Overview

If the fiber between the 2 sites is multi-mode, you need to use a multi-mode cable to the switch if it is single mode than you need a SM patch cord. If all your fiber is correct and tested than try to swap the fiber strand on one side of the connection and see if that help. I've verified to make sure that I am using the 10gig SFPs. The switches connect as expected when in the same room and connected using 1m or 3m patch cables. This is where it gets strange. Equipment cords are an integral part of any network—whether it's a fiber jumper used to make connections between fiber patching areas and switches in the data center or a copper patch cord out in the LAN to connect end devices to the work area outlet. Unfortunately, equipment cords are also. Patch cord polarity defines the directional optical path between two transceivers, ensuring that the transmit (Tx) signal from one device reaches the receive (Rx) port of the other. Here is the details: Device #1 - CISCO Catalyst 3550 (C3550-I9Q3L2-M) IOS 12. 1 (20)EA1a using a GBIC model # WS-G5486 (1000BASE-LX/LH with a 1300nm wavelength).
