

What is the working principle of a photovoltaic control module

Overview

Regardless of system type, the working principle remains the same: PV modules convert sunlight into direct current (DC) electricity, which is then converted into alternating current (AC) by an inverter, enabling power consumption or grid connection. Based on whether it relies on the public power grid, PV systems are divided into off-grid and on-grid. A Photovoltaic controller is one of the core components in a photovoltaic power generation system. The various types of solar PV modules, including monocrystalline, polycrystalline, P-type. Solar PV modules work on the principle of photovoltaic effect, which is the process of converting sunlight into electricity. When sunlight hits the photovoltaic cells, it releases electrons, which flow through the circuit and generate a current. Each module is made up of a grid of small solar cells. The cells are made of a semiconductive.
